

Example of Testing the Point or Fiber Arc-Flash Sensor

- Set the following in the SEL-751A relay.

| Setting Name | Setting Class | Value |
|--------------|---------------|--|
| 50PAFP | Global | Apply current higher than this setting |
| AFSENS1 | Global | Point or Fiber |
| AOUTSL0T | Global | 101_2 |
| OUT 102 | Logic Group | TRIP (50PAF OR 50NAF) AND TOL1 |
| TR | | |

Connection Diagram

SEL-4520 Arc-Flash Test Module

- Tests the functionality of a relay's arc-flash detection feature.
- Makes troubleshooting quick and easy.
- Serves double duty as a training aid for arc-flash detection.
- Facilitates testing with its portability.
- Can be used with the SEL-751 or the SEL-751A relays.

Major Features and Benefits

Application

The SEL-4520 device simultaneously applies current to an SEL-751 or SEL-751A while triggering an LED light or optional camera flash (not included). The duration of the light pulse is controlled through DIP switches, and the triggering of the light is controlled by a Demodulated IRIG input (light triggers at top of second) or through a pushbutton (TST/RST). Current circulates through the SEL-4520 and the test source until the TST/RST pushbutton is pressed (see [Front Selections and Connections](#)). Once TST/RST is pressed, the light is applied and current then circulates through the relay and the test source, simulating an arc-flash condition (see [Additional Selections and Connections](#)). The combination of current and light outputs from the SEL-4520 to the SEL-751 or SEL-751A can help in testing an overall Arc-Flash Detection (AFD) system (see [Example of Testing the Point or Fiber Arc-Flash Sensor](#)).

Front Selections and Connections

DANGER

Contact or de-energize all external connections before opening this device. Contact with hazardous voltages and currents inside this device can cause electrical shock resulting in injury or death.

CAUTION

Looking into optical connections, fiber ends, or bulkhead connections can result in hazardous radiation exposure.

120V IN:

Apply 120 Vac/Vdc as an option to remove current and reset the SEL-4520. This input is wired from a contact output of the relay to simulate a trip. Asserting this input after a triggered arc flash will remove the current from the relay.

TST/RST: Triggers an arc-flash event by switching the current to the relay while simultaneously pulsing light LED output and/or connected camera flash. Press again to reset the unit and remove the current from the relay.

IRIG Input:

Connecting the Demodulated IRIG source to the IRIG input synchronizes the current source to the LED light. IRIG requires that DIP Switch 9 be in the up position to set the unit to IRIG mode. The LED output pulses at each IRIG top-of-second marker.

DIP Switches: Switches 1-8 set the LED light pulse duration. To determine the light pulse duration, sum the switches.

EN/AL LEDs:

- The green EN LED indicates that the SEL-4520 is ready to trigger (ENABLED). The current (if connected) is circulating through the shunt path of the SEL-4520.
- The red AL LED indicates that the unit has triggered an arc-flash event (ALARM). The current (if connected) is circulating through the relay and the LED output (or camera flash, if attached) has pulsed.

Additional Selections and Connections

CAUTION

Looking into optical connections, fiber ends, or bulkhead connections can result in hazardous radiation exposure.

LED:

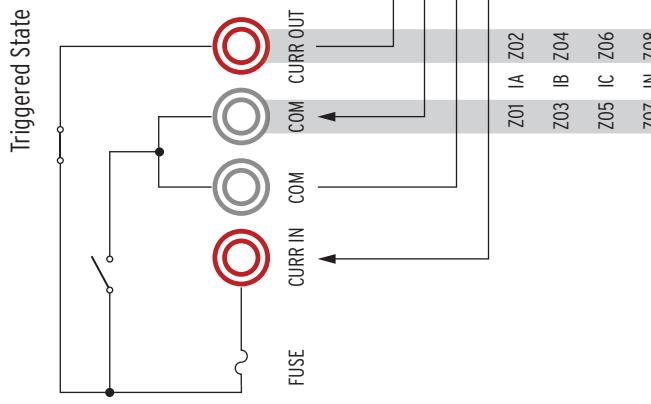

Connect the LED module to the LED BNC connector with the 8-foot BNC cable (included). If necessary, use a longer length BNC cable (50 ft. max.) to reach the arc-flash sensor.

FUSE:

The internal fuse protects the internal circuitry from excessive current. Replace it with a 6.3 A, 5 x 20 mm time-lag fuse, such as one of those listed below.

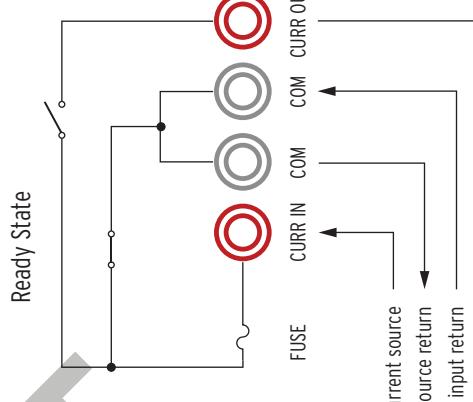

| Manufacturer | Part No. |
|----------------------|--------------------------|
| Schurter Bussmann | 0001.2512 BK/S505-6.3 |

Schematic Equivalent

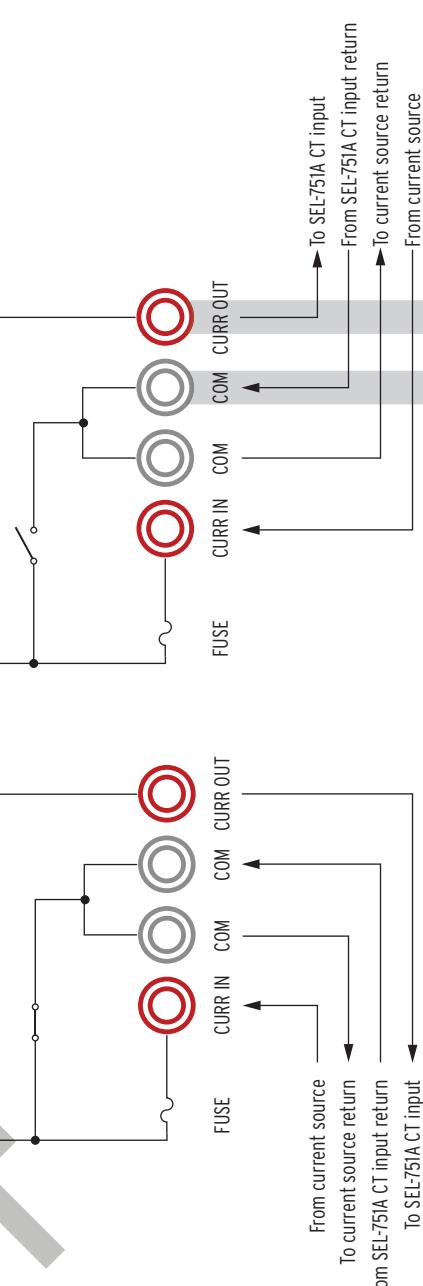

FLASH: The 2.5 mm FLASH connection is used to trigger an external camera flash (not included). A camera flash is useful for testing arc-flash sensors in switchgear that are not easily reached with the LED module.

NOTE: The charge time of the camera flash prevents the flash from activating in IRIG mode.
