4.11 Test devices

4.11.1 Introduction

Test devices are required in order to perform local tests of the 3VA6 molded case circuit breakers with electronic trip units (ETUs).

Two versions of the test devices are available:

- TD300 activation and trip box
- TD500 test device

### Functional scope of test devices

<sup>1)</sup> One energy transformer, one Rogowski coil

<sup>2)</sup> Via powerconfig
4.11.2 The TD300 activation and trip box

The TD300 activation and trip box is a mobile, battery-operated local test device. Its purpose is:

- To supply the ETU with power so that the ETU can be parameterized when the molded case circuit breaker is switched off and de-energized.
- To test and service the electronic trip unit (ETU).

The power supply is provided by two AA batteries included in the scope of supply.

The TD300 activation and trip box has a compact size of 3 x 4.21 x 1" / 76 x 107 x 25 mm (W x H x D).

Description of the TD300 activation and trip box

1. LED "ACT" for indicating the battery status
2. Slide switch ON/OFF
3. <TRIP> pushbutton for testing the molded case circuit breaker
4. 2 1.5 V AA batteries
5. Plug-in connector for insertion in the test socket on the ETU
4.11 Test devices

4.11.2.1 Operation and execution of the tripping function

**CAUTION**

**Personal Injury, unintentional tripping and irreparable damage to the TD300**

Use of the TD300 when the molded case circuit breaker is not de-energized can result in personal injury, unintentional tripping of the circuit breaker and irreparable damage to the TD300.

Disconnect the molded case circuit breaker from the power supply before using the TD300 activation and trip box.

**TD300: Connect, switch on and off, disconnect**

**Connect the TD300 to the 3VA molded case circuit breaker**

1. Disconnect the molded case circuit breaker from the power supply.
2. Insert the connecting cable in the test socket of the ETU.

**Switch the TD300 on and off**

1. Check whether the molded case circuit breaker is disconnected from the power supply. If it is not, disconnect it.
2. Push the slide switch to ON.
   The LED labeled "ACT" on the TD300 lights up and the ETU display is activated. The TD300 is ready.
   If the "ACT" LED does not light up:
   - Push the slide switch to OFF.
   - Detach the connecting cable from the molded case circuit breaker.
   - Replace the batteries.
   - Follow the correct sequence of steps to connect the unit to the molded case circuit breaker again.
   - Push the slide switch to ON.
3. Push the slide switch to OFF.
   The LED labeled "ACT" on the TD300 goes out to indicate that the unit is switched off.

**Disconnect the TD300 from the 3VA molded case circuit breaker**

1. Switch off the molded case circuit breaker (OFF position).
2. Detach the connecting cable from the molded case circuit breaker.
LED states when the TD300 and the molded case circuit breaker are switched on

<td>TD300 is ready ETU is not ready</td>
</tr>
</tbody>
</table>

Test the molded case circuit breaker (mechanical trip test)

1. Connect the TD300 to the molded case circuit breaker in the correct sequence and switch on.
2. Switch on the molded case circuit breaker (ON position).
3. Press the pushbutton labeled <TRIP> on the TD300.

**The molded case circuit breaker trips:**
The molded case circuit breaker is functioning correctly.

**The molded case circuit breaker does not trip:**
- Switch off the TD300.
- Switch off the molded case circuit breaker (OFF position).
- Detach the connecting cable from the molded case circuit breaker.
- Connect the TD300 correctly to the molded case circuit breaker again and switch on.
- Repeat the trip test (by pressing the pushbutton labeled <TRIP> on the TD300).
- If the molded case circuit breaker fails to trip again, contact Technical Support (Page 10).

4.11.3 The TD500 test device

4.11.3.1 General Information, preparations

The TD500 mobile test device can be used to test the different causes of ETU trips. This enables testing of the functioning and wiring of all connected system components before the 3VA6 molded case circuit breaker is commissioned. The system behaves as it would in the case of a real trip event. The molded case circuit breaker trips when the set delay times expire and signals all alarms and tripped signals from connected components.
Benefits of the TD500 test device

- With a TD500 test device, all 3VA6 molded case circuit breakers can be configured one after the other directly at the installation via powerconfig.
- The device can store up to 100 test results.
- With the TD500 test device and the powerconfig software, all diagnostic data of the 3VA6 molded case circuit breaker can be archived electronically or as a printed document.
- In addition, test functions can be performed directly on the PC with the powerconfig software.

Description of the TD500

1. Plug-in connector for insertion in the test socket on the ETU
2. TD500-to-ETU connecting cable
3. TD500 test device
4. Power supply unit
4.11 Test devices

- **1.** Connecting cable for ETU
- **2.** LED "LOG" (available memory status)
- **3.** LED "RESULT"
- **4.** Pushbutton for neutral trip test N

Interfaces of the TD500 test device

The diagram below shows the physical interfaces of the TD500 test device.

- Top of unit: Connection to 3VA UL molded case circuit breaker
- Bottom of unit on right: 24 V DC supply
- Bottom of unit on left: Connection to PC

Compatibility with molded case circuit breakers

The TD500 test device can be connected to all 3VA molded case circuit breakers with the ETUs 3-series, 5-series and 8-series. The connecting cable from the test device is inserted in the test socket of the ETU.
Data stored in the TD500

The following data are stored in the TD500:

- Article number
- ETU parameter settings
- Causes of ETU trips

Note

Readout of data and clearing of the internal memory of the TD500

Using a PC and the powerconfig software, you can read these data out of the TD500 and clear its internal memory.

Test functions of the TD500

The relevant pushbutton must be pressed in order to start a specific test. The molded case circuit breaker is tripped electronically when the pushbutton is actuated. This is essential to allow effectual testing of the electronic and mechanical control elements of the circuit breaker.

4.11 Test devices

4.11.3.2 Operation and execution of test functions

Connecting and disconnecting the TD500

⚠️ CAUTION

Personal Injury, malfunctions and false test results

Failure to connect the TD500 test device to the molded case circuit breaker according to the sequence of steps specified below can result in personal injury, malfunctions and false test results.

Disconnect the molded case circuit breaker from the power supply before connecting the TD500.

Strictly adhere to the sequence of steps described below for connecting the two devices.

Connect the TD500 to the 3VA6 molded case circuit breaker

1. Disconnect the molded case circuit breaker from the power supply.
2. Insert the connecting cable in the socket on top of the TD500 test device.
3. Insert the connecting cable in the test socket of the ETU.
4. Insert the cable of the power supply unit in the socket on the bottom of the TD500 test device.
5. Connect the power supply unit to a socket.

The TD500 test device is now switched on and ready.

6. Press the pushbutton labeled <ETU Power ON/OFF> on the TD500 test device.

The ETU is now powered via the TD500 and activated. Successful communication between the TD500 and ETU is indicated by illumination of the LED labeled "COM" on the TD500.

All test functions available for the connected ETU are indicated by illumination of the appropriately labeled LEDs.

Example: In this example, the L, S and I releases, the transformers (TRANS) and the current meter (METER) can be tested on the connected ETU:
4.11 Test devices

Disconnect the TD500 from the 3VA6 molded case circuit breaker

1. Switch off the 3VA6 molded case circuit breaker.
2. Press the pushbutton labeled <ETU Power ON/OFF> on the TD500 test device. The LED labeled "COM" on the TD500 goes out. The ETU is now no longer powered via the TD500 and is deactivated.
3. Disconnect the power supply unit from the socket.
4. Detach the power supply unit cable from the TD500.
5. Detach the connecting cable between the TD500 and the ETU.

Test tripping functions L, S, I, N and G

1. Connect the TD500 test device to the 3VA6 molded case circuit breaker, see above.
2. Switch on the 3VA6 molded case circuit breaker.
3. To test the tripping function, press one of the pushbuttons <L>, <S>, <I>, <N> or <G> on the TD500 test device.

– When a pushbutton is pressed, its LED flashes while the test is in progress.
– The ETU trips when the set trip times expire and the molded case circuit breaker switches from "ON" to "TRIP".
– On completion of the test, the LED of the selected pushbutton changes from flashing to steady illumination.

4. Wait for the test to end and evaluate the test result by the status of the LED labeled "RESULT":

Test was successful:
The LED "RESULT" lights up green.

Test was unsuccessful:
The LED "RESULT" flashes red.
Repeat the test. If the test fails again, contact Technical Support (Page 10).

5. Press the pushbutton for the same tripping function again in order to confirm the test result and restore the TD500 to its initial state.

6. Switch on the molded case circuit breaker again (ON position) in order to carry out further tripping function tests.
1. Connect the TD500 test device to the 3VA6 molded case circuit breaker.

2. Switch on the 3VA6 molded case circuit breaker.

3. Press pushbutton <L> on the TD500 test device.
   The LED in the pushbutton <L> starts to flash.

4. Wait until the LED in the pushbutton <L> changes from flashing to steady illumination.
   The test is completed.

5. Evaluate the test result by the status of the LED labeled "RESULT":
   LED "RESULT" is illuminated steadily in green: The test was successful.
   LED "RESULT" flashes red: The test was unsuccessful
   and must be repeated. If the test fails again, contact Technical Support (Page 10).

6. Press the pushbutton <L> again in order to confirm the test result and restore the TD500 to its initial state.
4.11 Test devices

Carry out a meter test

The purpose of the meter test is to determine whether the ETU is measuring and displaying current correctly. A test current of 0.4 x I_{rated} is fed into the ETU. The current value measured by the ETU is then checked to confirm that it matches the test current.

**Note**
The molded case circuit breaker does not need to be switched to position "ON" for this test.

**Execute the test**
1. Connect the TD500 test device to the 3VA6 molded case circuit breaker.
2. Press the pushbutton labeled <METER> ①.

   The LED in the <METER> pushbutton begins to flash. The test takes approximately 30 seconds.
3. Wait until the LED in the pushbutton <METER> changes from flashing to steady illumination. The test is completed.
4. Evaluate the test result by the status of the LED labeled "RESULT":
   - LED "RESULT" is illuminated steadily in green: **The test was successful**.
   - LED "RESULT" flashes red: **The test was unsuccessful** and must be repeated. If the test fails again, contact Technical Support (Page 10).
5. Press the pushbutton <METER> again in order to confirm the test result and restore the TD500 to its initial state.

**Test transformers**

This procedure tests the transformers (energy transformer or Rogowski coil) to determine the following:

- Are transformers installed in the ETU?
- Are transformers correctly installed in the ETU?
- Are the installed transformers functioning correctly?

**Note**
In order to carry out this test, it is absolutely essential to disconnect all external power supplies (e.g. EFB300, COM800, COM100, 24 V module) to the electronics.
Accessories

4.11 Test devices

**Execute the test**

1. Disconnect all external power supplies to the electronics.
2. Connect the TD500 test device to the 3VA6 molded case circuit breaker.
3. Switch on the 3VA6 molded case circuit breaker.
4. Press the pushbutton labeled <TRANS> ①.

![Pushbutton Diagram](image)

The LED in the <TRANS> pushbutton begins to flash. The test takes several seconds.

5. Wait until the LED in the pushbutton <TRANS> changes from flashing to steady illumination.
   The test is completed.

6. Evaluate the test result by the status of the LED labeled "RESULT":
   
   **LED "RESULT" is illuminated steadily in green:** The test was successful.
   
   **LED "RESULT" flashes red:** The test was unsuccessful and must be repeated. If the test fails again, contact Technical Support (Page 10).

7. Press the pushbutton <TRANS> again in order to confirm the test result and restore the TD500 to its initial state.
4.11.3.3 Executing the test functions using a PC and powerconfig

In addition to its capabilities as a stand-alone test device, the TD500 can also act as a PC interface to the ETU.

If the TD500 test device is connected both to the ETU and a PC, the protective functions can be triggered from a PC on which the powerconfig software is installed. A test log for the molded case circuit breaker is generated and stored in the powerconfig project. The test log can be printed out.

Connections between ETU - TD500 - PC

4.11.3.4 Parameterizing using the powerconfig software

In addition to test functions, the powerconfig software package also provides tools for assigning parameters to ETU 5-series and 8-series.

These tools allow you to:

- assign parameters to ETU 5-series and 8-series
- store parameter settings for ETU 5-series and 8-series in the powerconfig project and print them out
